TITLE OF INVENTION: CONFORMATIONALLY CONSTRAINED BACKBONE CYCLIZED SOMATOSTATIN ANALC
TITLE OF INVENTION: CONFORMATIONALLY CONSTRAINED BACKBONE CYCLIZED SOMATOSTATIN ANALC
TITLE OF INVENT APPLICATION NUMBER: US/10/916,522A
CURRENT FILING DATE: 2004-08-12
PRIOR PELLING DATE: 2000-12-13
NUMBER OF SEQ ID NOS: 10
SEQ ID NO S: 10
SEQ ID NO S: 10
SEQ ID NO S: 10
SEQ ID NO S: 10
                                                                    NAME/KEY: PEPTIDE

LOCATION: (1)..(8)

OTHER INFORMATION: (yclic eight-amino acid peptide. Phe (residue 1) is D-Phe. Trp

OTHER INFORMATION: (residue 4) is D-Trp. Lys (residue 5) is N-Fmoc-Lys or N-Fms-Lys.

OTHER INFORMATION: Thr (residue 8) is Thr-O-acetate.

FRATURE:

NAME/KEY: DISULFID

LOCATION: (2)..(7)

OTHER INFORMATION: Disulfide bond between the two Cys amino acid groups.

Publication No. US20060053516A1

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Li, Hong Ye

APPLICANT: Ramalingam, Sathiskumar

APPLICANT: Roon, Leo Lit km

APPLICANT: Peiris, Joseph Sriyal Malik

TITLE OF INVENTION: Genetically Modified Plants Comprising SARS-CoV Viral Nucleotide

TITLE OF INVENTION: Sequences and Methods of Use Thereof For Immunization Against SP

TITLE REPERENCE: 2587/73166/RDK

CURRENT APPLICATION NUMBER: US/11/004,399
                                                                                                                                                                                                                                                                                                                                                                                                                      ö

```
The present sequence is that of a synthetic somatostatin analogue. The peptide can be used as component B in a claimed composition comprising a somatostatin analogue of formula (A-B), where A is Cys, or a peptide chain comprising one or more Cys residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring to a drug or chelator via a thiol linkage. The drug is a naturally occurring comatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue(s) of component A by a thiol linkage. The drug is a therapeutic antianglogenic component A by a thiol linkage. The drug is a therapeutic cantianglogenic agent, at herapeutic gene, or a chemotherapeutic agent. The somatostatin analogue preferably binds to SSTR-positive cells. The somatostatin analogue preferably binds to SSTR-positive cells. The somatostatin analogue in which a detectable label is bound to the Cys residue(s) of component A, and disorder comprises administering a somatostatin analogue in which a therapeutic agent is bound to the Cys residue(s) of component A. The SSTR cassociated disorder is sepecially cancer. Thiol-mediated drug attachment cased with other targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Somatostatin; acromegaly; radiolocalisation; blood-brain barrier; cancer;

                                                                                                                 The invention provides for conventional somatostatin analogues (AAM48648) w48640 and AAM48664) and multi-tyrosinated analogues (AAM48641-W48645) which are the present one. The multi-tyrosinated somatostatin analogues bind to somatostatin receptors with practically the same affinity as thin the somatostatin. The somatostatin analogues are claimed to be useful native somatostatin. The somatostatin analogues are claimed to be useful for treating disease associated with increased production of factors which can be regulated by somatostatin, e.g. acromegaly. Also when radioactively labelled, the analogues are claimed to be useful for diagnosing cancer in vitro or in situ where aberrant expression of conditions cancer in vitro or in situ where aberrant expression of diagnosing cancer in vitro or in situ where aberrant expression of conactive the somatostatin receptors with such high affinity that binding is nearly irreversible under physiological conditions. Therefore, by improved sensitivity of radiolocalisation of the receptors willie.

Conventional somatostatin analogues, are resistant to enzymatic to enzymatic degradation and have increased half-lives in vivo relative to
                                                                                                                                                                                                                                                                                                                                                                          ö

Also described is a pharmaceutical composition Woc-4D and carrier for treating or preventing retinopathy of prematurity in neonatal mammal. The somatostatin analogue naving serum half-life of octreotide, womatostatin analogue having serum half-life of octreotide, somatostatin analogue having serum half-life of octreotide, or somatostatin analogue having serum half-life of woc-4D. It is selected from octreotide, lanreotide, vapreotide, woc-2B, Woc-3A, Woc-3B, Woc-3A, Woc-4D, Woc-5, or Woc-8B, The invention provides a therapeutic benefit without affecting growth of the neonates. The present sequence represents somatostatin analogue, Woc-4D.
                                                                                                                                                                                          Treatment or prevention of retinopathy of prematurity in neonatal mammal, comprises administering somatostatin analog having composition that provides therapeutic benefit to mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Deptide can be used as component B in a claimed composition comprising somatostatin analogue of formula (A-B), where A is Cys, or a peptide can be used as component B in a claimed composition comprising or chain comprising one or more Cys residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring or synthetic somatostatin peptide, or its fragment, that binds to the somatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue (s) of component A by a thiol linkage. The drug is a therapeutic drug such as a radioisotope, a cytotoxin, an immunostimulant, an antiguidenia, a therapeutic gene, or a chemotherapeutic agent. The somatostatin analogue preferably binds to SSTR-positive cells. The somatostatin analogue preferably binds to SSTR-positive cells comprises administering the somatostatin analogue in which detecting the label is bound to the Cys residue (s) of component A, and detecting the label is bound to the Cys residue (s) of component A, and discorder comprises administering a somatostatin analogue in which a sessociated disorder is especially cancer. Thiol-mediated drug attachment can also be used with other targeting peptides.
                                                                                                                        A composition comprising a somatostatin analog useful for thiol-specific drug attachment to somatostatin and other targeting peptides, or for diagnosing or treating somatostatin receptor-associated disorders, e.g.
                                                                                                                                                                                                                                                                              present sequence is that of a synthetic somatostatin analogue. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                The specification describes a dispersed phase formulation which comprises a biocompatible and biodegradable polymer, at least one nucleophilic substance capable of catalyzing ester bond cleavage and causing molecular weight reduction of the polymer, and acid additive in an amount such that the polymer is less susceptible to molecular reduction as compared to the formulation without the acid additive. The formulation of the invention is useful for preparing microspheres providing a sustained or controlled release of drug. This is useful for suppressing gonadotropin releasing prostate hypertrophy or prostate cancer. The present disorder, benign woods a some angles of an analog), a peptide which was contained in
                                                                                                                                                                                                                                   Dispersed phase formulation useful for providing sustained release of drug suppressing gonadotropin releasing hormone comprises nucleophilic substance catalyzing ester bond cleavage and causing molecular weight reduction of polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                        The present sequence is that of a synthetic somatostatin analogue. The peptide can be used as component B in a claimed composition comprising a somatostatin analogue of formula (A-B), where A is Cys, or a peptide chain comprising one or more Cys residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring to a drug or chelator is peptide, or its fragment, that binds to the cys comatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue(s) of component A by a thiol linkage. The drug is a therapeutic drug such as a radioisotope, a cytotoxin, an immunostimulant, an antiopage preferably binds to SSTR-positive cells. The somatostatin analogue preferably binds to SSTR-positive cells. A claimed method for detecting SSTR-cspecially human cancer cells. A claimed method for component A, and detectable label is bound to the Cys residue(s) of component A, and disorder comprises administering the somatostatin analogue in which a therapeutic agent is bound to the Cys residue(s) of component A, and theoreting the label. A claimed method for treating an SSTR-associated disorder is sepecially cancer. Thiol-mediated drug attachment can also be used with other targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein conjugate, thiol-reactive diagnostic, thiol-reactive therapeutic agent, disulfide-containing targeting protein; thiol-containing peptide linker.
                                                                                           A composition comprising a somatostatin analog useful for thiol-specific drug attachment to somatostatin and other targeting peptides, or for diagnosing or treating somatostatin receptor-associated disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention describes a method of producing a diagnostic or therapeutic conjugate of a protein, polypeptide or peptide containing one disulfide bond(s). The method involves contacting protein, polypeptide or peptide with a thiol-reactive diagnostic or therapeutic agent, either preformed or generated in situ to form a stable diagnostic therapeutic conjugate of protein, polypeptide or peptide without substantial cleavage of disulfide bond(s). The polypeptides are useful for introducing thiol-containing linkers into disease targetting agents e.g. polypeptide and peptides. The method enables the formation of conjugates of disulfide-containing fragments and with thiol-containing ligands without cleaving the disulfide bonds of the targetting proteins. This is the amino acid sequence of a thiol-containing peptide linker that can be conjugated to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Osteopathic, cytostatic, antidiarrhoeic, antiinflammatory; antipsoriatic, hypertenstive; dermatological; antithyroid; immunomodulator; vasotropic; antilipaemic, somatostatin agonist; Cushing's syndrome; gonadotropinoma;
